

**Aim**

To understand navigation between multiple screens in an Android application using explicit intents.

**Procedure**

1. Open Android Studio.
2. Create a new project (Empty Activity, Kotlin).
3. Design the main screen with:
  - Background image
  - Buttons (Home, Next, Back)
4. Create additional activities (SecondActivity / HomeActivity if needed).
5. Design layouts for each activity.
6. Use **Intent** to navigate between activities.
7. Run the app and test navigation using buttons.

**Code****activity\_main.xml (UI similar to your image)**

```
<?xml version="1.0" encoding="utf-8"?>
<RelativeLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:layout_width="match_parent"
    android:layout_height="match_parent">

    <!-- Background Image -->
    <ImageView
        android:layout_width="match_parent"
        android:layout_height="match_parent"
        android:src="@drawable/bg_space"
        android:scaleType="centerCrop"/>

    <!-- Buttons -->
    <LinearLayout
        android:layout_width="match_parent"
        android:layout_height="wrap_content"
        android:layout_alignParentBottom="true"
        android:gravity="center"
        android:orientation="horizontal"
        android:padding="16dp">

        <Button
            android:id="@+id/btnBack"
            android:text="Back"/>
```

```

        <Button
            android:id="@+id/btnHome"
            android:text="Home"
            android:layout_margin="10dp"/>

        <Button
            android:id="@+id/btnNext"
            android:text="Next"/>
    </LinearLayout>

</RelativeLayout>

```

## MainActivity.kt

```

package com.example.appnavigationdemo

import android.content.Intent
import android.os.Bundle
import android.widget.Button
import androidx.appcompat.app.AppCompatActivity

class MainActivity : AppCompatActivity() {

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)
        setContentView(R.layout.activity_main)

        val btnNext = findViewById<Button>(R.id.btnNext)
        val btnHome = findViewById<Button>(R.id.btnHome)

        btnNext.setOnClickListener {
            startActivity(Intent(this, SecondActivity::class.java))
        }

        btnHome.setOnClickListener {
            startActivity(Intent(this, MainActivity::class.java))
        }
    }
}

```

## SecondActivity.kt

```
package com.example.appnavigationdemo

import android.os.Bundle
import androidx.appcompat.app.AppCompatActivity

class SecondActivity : AppCompatActivity() {

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)
        setContentView(R.layout.activity_second)
    }
}
```

## activity\_second.xml

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:gravity="center"
    android:orientation="vertical"
    android:layout_width="match_parent"
    android:layout_height="match_parent">

    <TextView
        android:text="Welcome to Second Activity"
        android:textSize="22sp"/>
</LinearLayout>
```

## Result

The application successfully:

- Displays a styled main screen
- Navigates between activities using buttons
- Demonstrates the use of **explicit intents**
