

Aim

To understand the basics of Kotlin programming by creating a simple Android application that displays student details using variables and TextView.

Procedure**1. Open Android Studio**

- Launch Android Studio.
- Click **New Project**.

2. Create New Project

- Select **Empty Activity**.
- Click **Next**.
- Set the following:
 - Name: StudentDetails
 - Language: Kotlin
 - Minimum SDK: API 21 or above
 - Build Configuration: View-based
- Click **Finish**.

3. Design Layout (UI)

- Go to:
app → res → layout → activity_main.xml
- Add a **TextView** to display output.

4. Write Kotlin Code

- Open:
MainActivity.kt
- Declare variables for student name and roll number.
- Set the values to TextView.

5. Run the Application

- Create or start an emulator.
- Click **Run**.
- Observe output on the screen.

Kotlin Code

activity_main.xml

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:gravity="center"
    android:orientation="vertical">

    <TextView
        android:id="@+id/txtOutput"
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:textSize="20sp"/>
</LinearLayout>
```

MainActivity.kt

```
package com.example.studentdetails

import android.os.Bundle
import android.widget.TextView
import androidx.appcompat.app.AppCompatActivity

class MainActivity : AppCompatActivity() {

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)
        setContentView(R.layout.activity_main)

        val output = findViewById<TextView>(R.id.txtOutput)

        // Student details
        val name = "Ravi"
        val rollNo = 101

        // Display result
        output.text = "Student Name: $name\nRoll No: $rollNo"
    }
}
```

Result

The application successfully displays the student details:
