

Aim

To understand and implement functions in Kotlin by defining functions with parameters, return types, and calling them to display output in an Android application.

Procedure

1. Open Android Studio.
2. Open your project.
3. Go to:
res → layout → activity_main.xml
4. Add a **TextView** to display output.
5. Open MainActivity.kt and:
 - Define functions inside the class.
 - Call those functions inside onCreate().
 - Display results using TextView.
6. Run the application on emulator/device.
7. Observe the output.

Code**activity_main.xml**

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:gravity="center"
    android:orientation="vertical">

    <TextView
        android:id="@+id/txtOutput"
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:textSize="20sp"/>
</LinearLayout>
```

MainActivity.kt

```
package com.example.kotlinbasics

import android.os.Bundle
import android.widget.TextView
import androidx.appcompat.app.AppCompatActivity

class MainActivity : AppCompatActivity() {

    // Function with parameters and return type
    fun add(a: Int, b: Int): Int {
        return a + b
    }

    // Function with parameter and return type
    fun greet(name: String): String {
        return "Hello, $name"
    }

    // Function without parameters
    fun welcomeMessage(): String {
        return "Welcome to Kotlin Functions"
    }

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)
        setContentView(R.layout.activity_main)

        val txt = findViewById<TextView>(R.id.txtOutput)

        val result1 = add(10, 20)
        val result2 = greet("Ravi")
        val result3 = welcomeMessage()

        txt.text = "$result3\n$result2\nSum = $result1"
    }
}
```

Result

The application successfully demonstrates function usage and displays:
